DILIsym User Training –

Introduction to Quantitative Systems Toxicology (QST) and the DILIsym Software

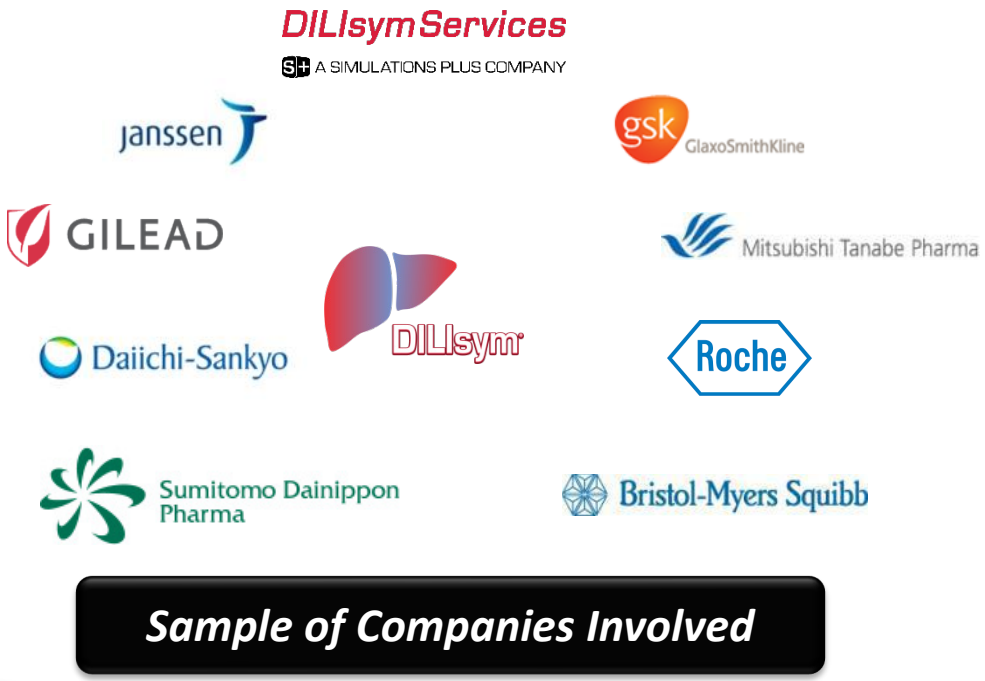
DILIsym Development Team

Goals for the QSP and DILIsym Introduction Training Session

Participants should understand the following general concepts:

- The concepts behind quantitative systems pharmacology/toxicology (QSP/QST)
- Introductory design concepts behind the DILIsym QST software platform
- The typical high-level workflow for using DILIsym for prediction
- Background information on the innate immune sub-model within DILIsym
- DILIsym validation projects done to-date
- Example applications of DILIsym use in pharma

The DILI-sim Initiative is a Partnership between DILIsym Services and Pharmaceutical Companies to Minimize DILI



Sample of Companies Involved

- *Overall Goals*
  - *Improve patient safety through QST*
  - *Reduce the need for animal testing*
  - *Reduce the costs and time necessary to develop new drugs*
- *History*
  - *Officially started in 2011*
  - *19 major pharmaceutical companies have participated*
  - *Members have provided compounds, data, and conducted experiments to support effort*
  - *Over $8 million total invested in project*

What Are QSP and QST? Some Definitions

"The **integration** of **biological mechanisms** (from **sub-cellular to patient cohorts**) in **quantitative** mechanistic **models** and their application in the **discovery and development** of pharmaco-therapeutics."

UK QSP Network (http://www.qsp-uk.net/themes.html; accessed 2016-07-06)

"The **quantitative** analysis of the **dynamic interactions** between **drug(s)** and a **biological system** to understand the behaviour of the **system as a whole**, as opposed to the behaviour of its individual constituents."

van der Graaf and Benson (2011) Pharm Res 28(7):1460-1464. doi:10.1007/s11095-011-0467-9

"An approach to **translational** medicine that combines **computational and experimental methods** to elucidate, validate and apply new pharmacological concepts to the development and use of **small molecule and biologic drugs**...to determining **mechanisms of action** of new and existing drugs in **preclinical and animal models and in patients**."

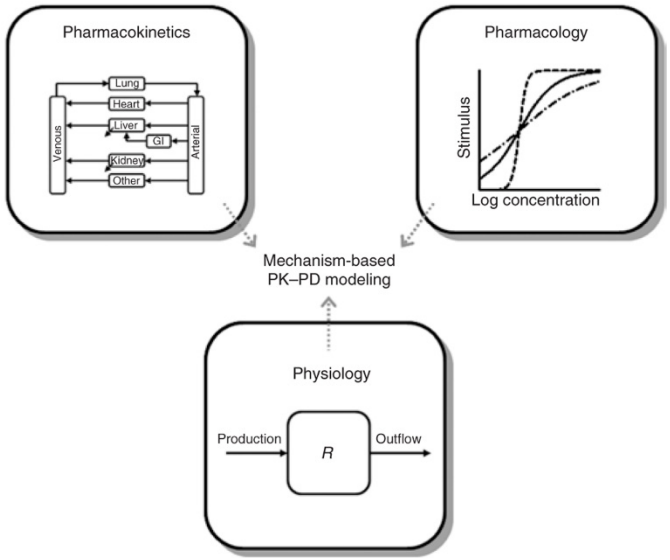
Sorger et al. (2011) NIH QSP Working Group White Paper
https://www.nigms.nih.gov/training/documents/systemspharmawpsorger2011.pdf

Slide courtesy of CJ Musante

The Intersection of PK, PD, and QSP/QST

Pharmacokinetics (PK): What the body does to a drug
Pharmacodynamics (PD): What a drug does to the body
QSP/QST: PK and PD extended to effects at the systems level (e.g., disease modification)

PK and PD



QSP

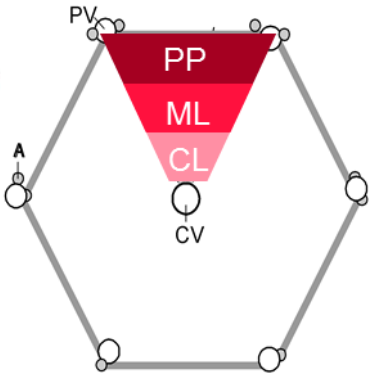
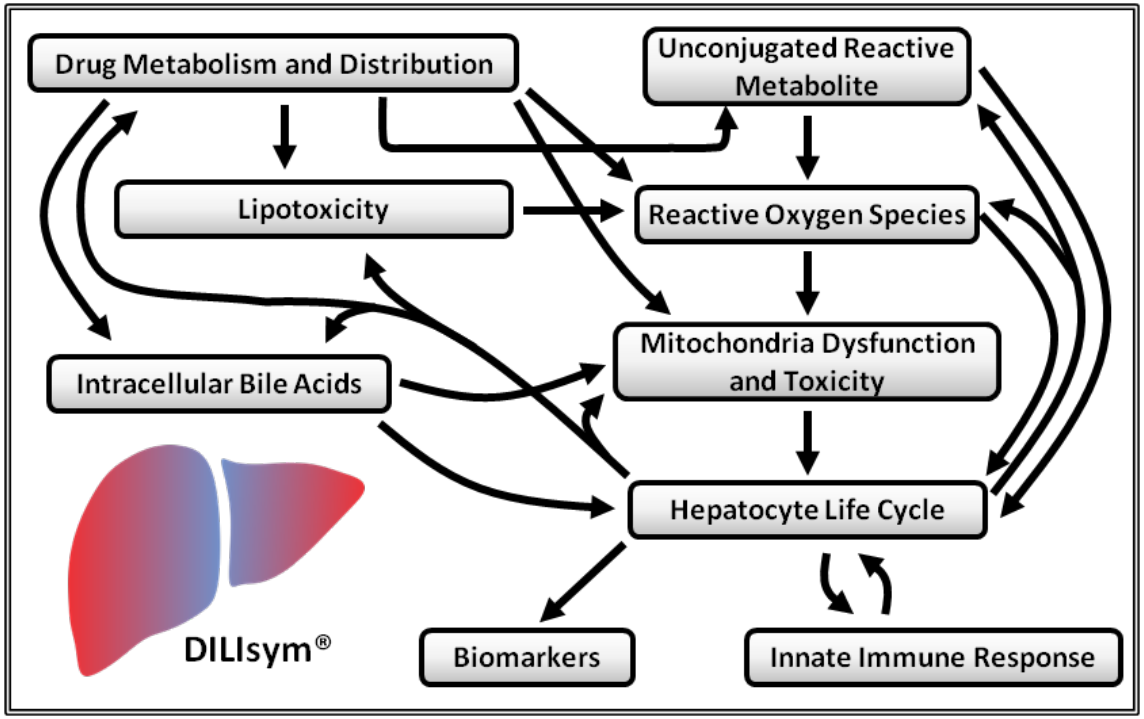
DILIsym Overview

- **Multiple species: human, rat, mouse, and dog**
  - Population variability
- **The three primary acinar zones of liver represented**
- **Essential cellular processes represented to multiple scales in interacting sub-models**
  - Pharmacokinetics
  - Dosing (IP, IV, Oral)
  - Transporter Inhibition
  - Drug metabolism
  - GSH depletion
  - Injury progression
  - Mitochondrial dysfunction, toxicity, DNA depletion
  - Bile acid mediated toxicity
  - Steatosis and lipotoxicity
  - Cellular energy balance
  - Hepatocyte apoptosis and necrosis, and proliferation
  - Macrophage, LSEC life cycles
  - Immune mediators
  - Caloric intake
  - Biomarkers



- **Over 30 detailed representations of optimization or validation compounds**
- **Single and combination drug therapies**



DILIsym Services

A SIMULATIONS PLUS COMPANY

DILIsym Utilizes Various Data Types to Inform Decisions

Exposure Data

PBPK Modeling

- **Compound Properties**
  - Tissue partition coefficients
- **Tissue penetration studies**
  - *Liver to blood ratio*
- **Pharmacokinetic data**
  - *Absorption, extra-hepatic clearance, metabolites*
- ***in vitro* data**
  - *Metabolite synthesis, active uptake*

Modeling & Simulation

Simulations and Assays inform:

- **Prediction of DILI risk**
- **Participating DILI mechanisms**
- **Characteristics of patients at risk for DILI**
- **Drug dosing paradigms**
- **DILI monitoring strategies**

In vitro Mechanistic DILI Data

Assays performed to determine quantitative aspects of DILI mechanisms

- **Oxidative stress**
  - *Direct and reactive metabolite-mediated*
- **Mitochondrial toxicity**
  - *ETC inhibition*
  - *Uncoupling*
- **Bile acid transporter inhibition**
  - *BSEP, MRP3 and 4, NTCP*
- **Bilirubin transport/metabolism**
  - *OATP1B1, OATP1B3, UGT1A1, MRP2, MRP3*

Clinical Data

- **Dosing Protocols, fasting/fed state, meal times**
- **Anthropometric data**
  - **Body weight, age, ethnicity**
- **Pharmacokinetic data**
  - **Absorption, extra-hepatic clearance, metabolites**

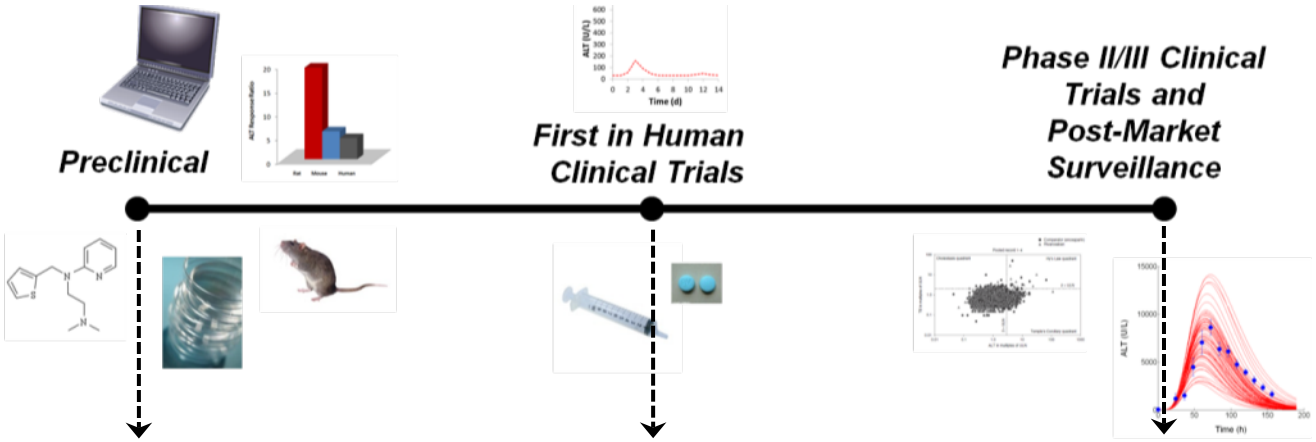
Applications of DILIsym Along the Drug Development Pipeline

Predictions of hepatotoxicity for humans and preclinical animal models



• Mechanism exploration • Rank candidates for DILI potential • Extrapolation from animal and *in vitro* findings to humans	• Dose optimization (risk versus presumed benefit) • Infer magnitude of injury based on measured biomarkers • Extrapolation from healthy volunteers to patient groups • Guide incorporation of emerging biomarker measurements in clinical trials • Analysis of mechanisms underlying observed liver signals	• Inform choice and timing of biomarker measurement • Aid identification of risk factors leading to personalized medicine approaches • Analysis of mechanisms underlying observed liver signals

Biomarkers of Hepatocellular Function and Death Are Outputs of DILIsym

- Biomarkers are outputs of DILIsym
  - Used for validation
  - Used for comparison with clinical and preclinical data
  - Functional, necrotic, and apoptotic indicators
- More biomarkers being added as data are becoming available
  - GLDH
- Additional DILIsym outputs include:
  - Fraction of viable hepatocytes
  - Liver ATP
  - Liver glutathione
  - Circulating, liver, and excreted drug and metabolites

Marker	Category
Alanine aminotransferase (ALT)[1,2,3,4,5]	Necrosis
Bilirubin (total)[1,2,5]	Function/Cholestasis
Aspartate aminotransferase (AST)[1,2,3,4,5]	Necrosis
Prothrombin time [1,2]	Function
High mobility group box protein 1 (HMGB1)[1,10]	Necrosis/Apoptosis
Full length cytokeratin-18[1]	Necrosis
Cleaved cytokeratin-18[1]	Apoptosis
Sorbitol dehydrogenase (SDH)[1,6]	Necrosis
Arginase-1[9]	Necrosis
Liver derived mRNA[7] and miRNA[8] (miR122)	Necrosis

DILIsym Performance Review – Level 1

- Key Question: would the weight of evidence from the drug case and from the DILIsym results have led to the same overall conclusion regarding the presence or absence of a possible drug-induced liver injury liability for the compound?
  - Secondary question: was the general magnitude of injury over-predicted (O), under-predicted (U), or correctly predicted (C), based on severity and frequency of injury?

Mediators Derived from Immune Cells Implicated in DILI and/or Recovery

MICE

- Functional role in DILI generally defined by addition of exogenous or blockade of endogenous mediator
  - *e.g.,* anti-HMGB1, anti-TNF-α, exogenous HGF
- Mechanistic attributes generally defined by *in vitro* studies
  - May also drive required inclusion
- Exposure profile generally defined by plasma measurements
- Initial focus on APAP
  - HMGB1, TNF-α, IL-10, (VEGF), HGF

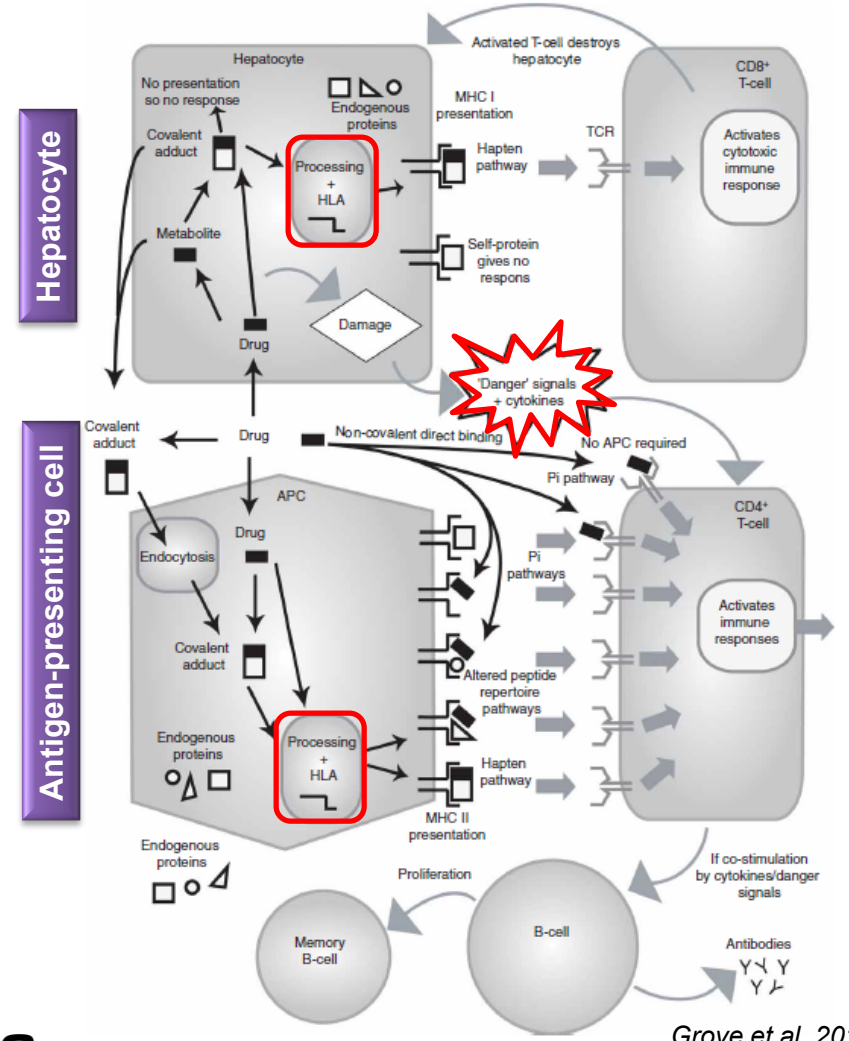
Evidence for T Cells Indirectly Supports Activation of Innate Immune Cells

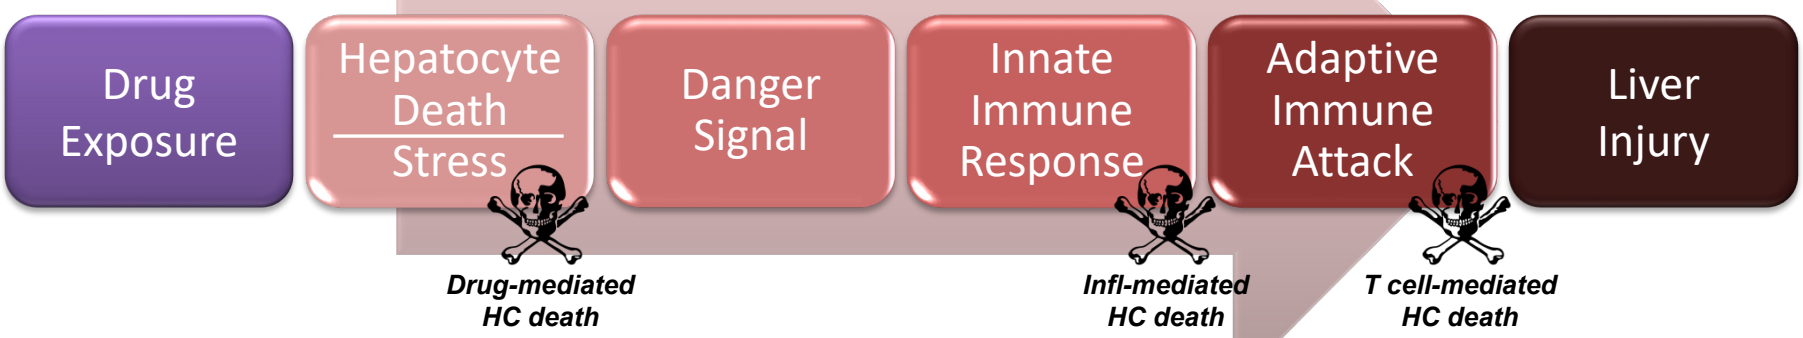
- Genome wide association studies (GWAS) have identified associations between human leukocyte antigen (HLA) alleles and some DILI compounds
- While these associations implicate an adaptive immune response, they also implicate activation of innate immune cells
  - Innate immune cells, particularly dendritic cells, are professional antigen-presenting cells, typically needed for initiation of T cell response
  - Activating signals (*e.g.*, DAMPs, cytokines) required for upregulation of key molecules involved in antigen presentation
  - Cytokines provide “signal 3” in T cell differentiation, shaping the character of resultant response



Grove et al. 2014

Intrinsic Drug Toxicity and Subsequent DAMP Release Drive Innate Immune Activation

Theory on sequence of events driving potential contributors to liver injury, including intrinsic drug toxicity, sterile inflammation, and adaptive immune attack.



Current DILIsym representation allows for intrinsic drug toxicity, with potential initiation of sterile inflammation, including TNF-α mediated necrosis or apoptosis.

Project Example Executive Summary

DILIsym Validation Using Clinical Data for Compound X

- ALT elevations were predicted in DILIsym simulations of previous Compound X clinical protocols where liver injury occurred clinically
  - Predicted delayed ALT elevations due to accumulation of a Compound X metabolite over time within DILIsym
  - Compound X metabolite-mediated mitochondrial electron transport chain (ETC) inhibition and oxidative stress (ROS) were responsible for predicted ALT signals

Prospective Compound X Development using DILIsym

- Optimal, prospective (much lower) dosing protocols were identified to achieve maximum drug efficacy using the DILIsym software and a custom SimPops with Compound X PK variability included
- ALT elevations were not predicted to occur in DILIsym simulations of Compound X dosing at the optimal, prospective clinical dose levels identified from the exposure simulations

Final DILIsym Input Parameters For Compound X and Compound X Metabolite

Compound	Mechanism	Parameter	Unit	Value*
Compound X	Mitochondrial Dysfunction	Coefficient for ETC Inhibition 1	µM	3.5×10^{6}
Compound X Metabolite	Oxidative Stress	RNS/ROS production rate constant 1	mL/mol/hr	3×10^{-5}
	Mitochondrial Dysfunction	Coefficient for ETC Inhibition 2	µM	2000
		Coefficient for ETC Inhibition 3	µM	50
		Max inhibitory effect for ETC inhibition 3	Dimensionless	0.4

* Values shown in the table for DILIsym input parameters should not be interpreted in isolation with respect to clinical implications, but rather, should be combined with exposure in DILIsym to produce simulations that have predictive and insightful value

Compound X Clinical Protocols for DILIsym Hepatotoxicity and Exposure Simulations

Past Clinical Studies

- 0.3X mg Compound X, 16 weeks
- 0.5X mg Compound X, 16 weeks
- 1X mg Compound X, 16 weeks

No clinical stop protocol

ETC Inhibition and Oxidative Stress Contribute to Simulated Compound X Hepatotoxicity

- 1X Compound X dosing simulated in the sensitive SimCohorts (n=16) for 16 weeks to investigate underlying mechanisms of toxicity
  - One or two mechanisms eliminated sequentially
- Compound X Metabolite-mediated ETC inhibition and oxidative stress are main drivers of predicted toxicity
  - No toxicity predicted in simulations without Compound X metabolite effects (case VI)
- Parent Compound X has a negligible impact on predicted hepatotoxicity

Case	DILI Mechanism			Simulated Grade 1 ALT and Above
	Compound X ETCi	Compound X Metabolite ETCi	Compound X Metabolite ROS	
I	On	On	On	15/16
II	**Off**	On	On	15/16
III	On	**Off**	On	14/16
IV	On	On	**Off**	15/16
V	**Off**	**Off**	On	14/16
VI	On	**Off**	**Off**	0/16
VII	**Off**	On	**Off**	14/16

*SimCohorts Human_ROS_apop_mito_BA_v4A_1_Multi16 (n=16) used.
**Upper limit of normal (ULN) in DILIsym is 40 U/L.
ETCi – mitochondrial electron transport chain inhibition.
OS – oxidative stress.

Compound X Clinical Protocols for DILIsym Hepatotoxicity and Exposure Simulations

Past Clinical Studies

- 0.3X mg Compound X, 16 weeks
- 0.5X mg Compound X, 16 weeks
- 1X mg Compound X, 16 weeks

Prospective Studies

- 0.13X Compound X loading dose / 0.07 Compound X steady state dose, 32 weeks total
- 0.07X Compound X loading dose / 0.03 Compound X steady state dose, 32 weeks total

Customized SimPops Constructed to Recapitulate Compound X PK Variability

- Variability in parameters specific to Compound X and Compound X metabolite exposure superimposed on the existing human normal healthy volunteer SimPops (v4A_1 SimPops)
  - Existing SimPops: Human_ROS_apop_mito_BA_v4A_1 (N = 285)
  - Existing SimPops includes variability in oxidative stress, mitochondrial function, and bile acid transport
  - 285 Compound X ADME parameter combinations assigned randomly to existing individuals in v4A_1 SimPops within DILIsym
- Clinical PK data used to optimize and validate the Compound X PK SimPops
  - Clinical PK data employed for optimization
- Log-normal distribution used to select parameter values
  - 15 parameters varied
  - Metabolism Vmax distribution taken from distribution reported in literature
  - Standard deviation of 80% and 53% mean parameter value used for Compound X- and Compound X metabolite-related parameters, respectively, to represent observed PK variability

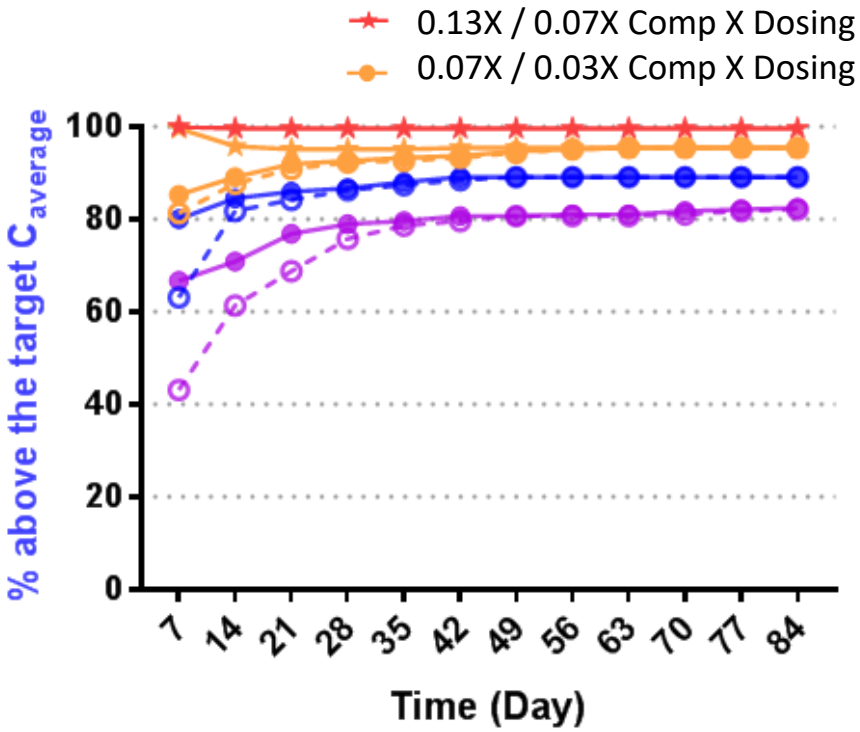
Prospective Doses Identified Showing Good Compound X Exposure

- The percentage of the simulated population who achieved the target Compound X $C_{average}$ at the steady-state increases with increasing daily maintenance dose
  - Two protocols taken forward for safety simulations

- The higher the loading dose, the greater percentage of the simulated population achieving the target during the first few weeks



No Hepatotoxicity Predicted for Additional Prospective Clinical Protocols

- Compound X effects simulated in SimPops (n=285) that represent variability in toxicity mechanisms and PK
- DILIsym predicted delayed hepatotoxicity with varying grades for previous clinical protocols
- **No ALT elevations predicted for additional prospective clinical protocols**

	Comp X Protocol	Grade 1 (ALT 1-2.5X ULN*)		Grade 2 and above (ALT > 2.5X ULN)

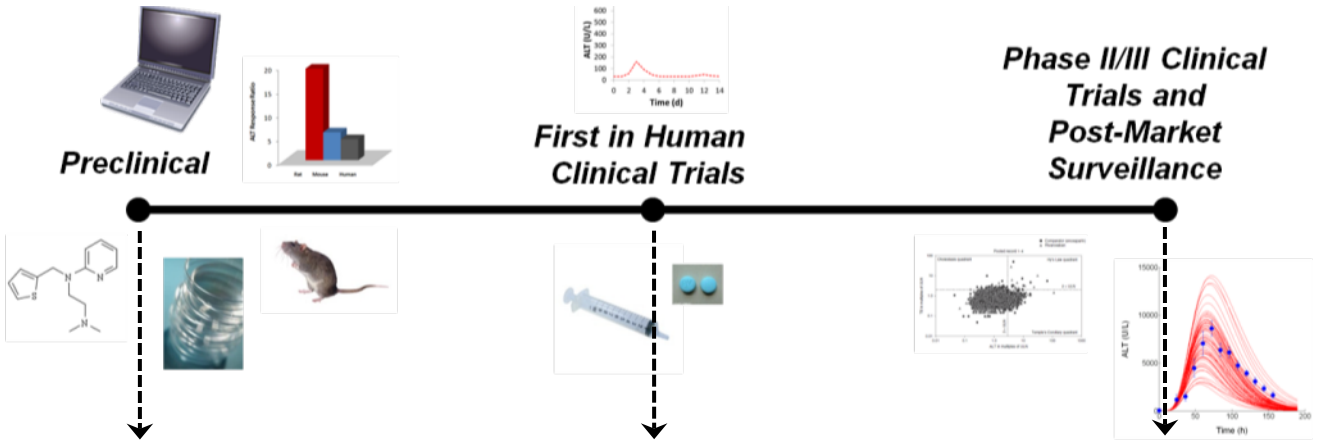
Applications of DILIsym Along the Drug Development Pipeline

DILIsym®

Predictions of hepatotoxicity for humans and preclinical animal models



Preclinical	First in Human Clinical Trials	Phase II/III Clinical Trials and Post-Market Surveillance
• Mechanism exploration • Rank candidates for DILI potential • Extrapolation from animal and in vitro findings to humans	• Dose optimization (risk versus presumed benefit) • Infer magnitude of injury based on measured biomarkers • Extrapolation from healthy volunteers to patient groups • Guide incorporation of emerging biomarker measurements in clinical trials • Analysis of mechanisms underlying observed liver signals	• Inform choice and timing of biomarker measurement • Aid identification of risk factors leading to personalized medicine approaches • Analysis of mechanisms underlying observed liver signals

Lixivaptan Background

- Lixivaptan is Palladio Bio's selective, competitive vasopressin V2 receptor antagonist
- Lixivaptan was originally developed by others for the treatment of hyponatremia associated with heart failure and syndrome of inappropriate antidiuretic hormone secretion (SIADH)
- An NDA for lixivaptan was filed in 2011; development was terminated following receipt of a CRL in 2012
- Palladio Biosciences acquired lixivaptan and intends to reposition lixivaptan for the treatment of Autosomal-Dominant Polycystic Kidney Disease (ADPKD)

Lixivaptan DILIsym Project

DILI Background

- An approved compound in the same class had no DILI signals in hyponatremia, but signals were observed in ADPKD patients
- Lixivaptan has had no DILI signals in hyponatremia

Question

- Will lixivaptan experience similar DILI liability as the competitor in ADPKD patients?

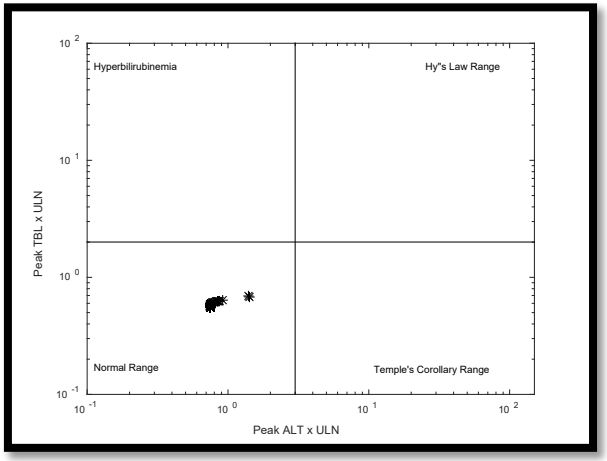
Approach

- Develop a mechanistic representation of lixivaptan in DILIsym, a QST model of drug-induced liver injury (DILI), to assess the potential for liver toxicity with the intended dosing for lixivaptan

Lixivaptan Project Executive Summary

- Simulations of lixivaptan dosing in custom SimPops of 285 simulated individuals with exposure variability show no ALT elevations (0/285 >2X ULN) at 200/100 mg BID dosing
- The DILIsym results suggest that lixivaptan is likely safer than the competitor
  - Competitor had significant ALT elevations at its clinical dose (simulated and clinically observed); lixivaptan simulations predict none

Simulated 200/100 mg dosing over 12 weeks in Custom SimPops of 285 with PK variability



Simulation Results

DILIsym Services

Lixivaptan Simulations Predict Minimal ALT Elevations at 200/100 mg BID

- Lixivaptan simulated in the custom n=285 individual SimPops including PK variability
- No ALT elevations simulated in 100 mg BID 60-day simulation
  - Consistent with observed clinical similarity to placebo
- 7/285 (2.46%) of simulated individuals had ALT elevations with 400 mg BID for 7 days
  - Simulations more conservative than clinical data from a safety standpoint
- No ALT elevations simulated in 200/100 split daily dosing scenario for 12 weeks
  - Maximum intended clinical dosing for ADPKD
  - Highest simulated ALT = 57 U/L
- Dose escalation simulations suggest possible ALT elevations at doses beyond the intended maximum clinical dose (not shown)

Dose and Duration	Parameter Settings	Clinical ALT > 3x ULN	Simulated ALT >3X ULN*
100 mg BID for 60 days	Default measured#	On treatment similar to placebo**	0/285
400 mg BID for 7 days	Default measured#	0/67	7/285
200 / 100 mg for 12 weeks	Default measured#	Study not yet conducted	0/285

*Upper limit of normal (ULN) in DILIsym is 40 U/L

**In study CK-LX3401, 8/315 individuals in the treatment group had ALT > 200 U/L, compared to 6/319 in the placebo group; this was judged to not be a statistically significant increase in AEs due to lixivaptan treatment.

#Default assumption for BA inhibition is mixed inhibition type with $\alpha = 5$ in the absence of K_i studies, based on the experience of the DSS team.

Clinical Application – Dose Selection

- ALT elevations are correlated with total lixivaptan exposure
- Project established exposure threshold below which lixivaptan is safe ($AUC_{0\text{-}7\ days}$< 350 µg*h/ml)
- Existing data indicate lixivaptan exposure rarely exceeds the exposure threshold
- Intended clinical dose not expected to exceed threshold
